# Lesson 11: Efficacy of Scientific Notation

# Classwork

#### Exercise 1

The mass of a proton is

0.000 000 000 000 000 000 000 000 001 672 622 kg.

In scientific notation it is

## Exercise 2

The mass of an electron is

In scientific notation it is

#### Exercise 3

Write the ratio that compares the mass of a proton to the mass of an electron.

#### **Exercise 4**

Compute how many times heavier a proton is than an electron (i.e., find the value of the ratio). Round your final answer to the nearest one.

### Example 2

The U.S. national debt as of March 23, 2013, rounded to the nearest dollar, is \$16,755,133,009,522. According to the 2012 U.S. census, there are about 313,914,040 U.S. citizens. What is each citizen's approximate share of the debt?

$$\frac{1.6755 \times 10^{13}}{3.14 \times 10^8} = \frac{1.6755}{3.14} \times \frac{10^{13}}{10^8}$$
$$= \frac{1.6755}{3.14} \times 10^5$$
$$= 0.533598... \times 10^5$$
$$\approx 0.5336 \times 10^5$$
$$= 53360$$

Each U.S. citizen's share of the national debt is about \$53,360.

#### Exercise 5

The geographic area of California is 163,696 sq. mi., and the geographic area of the U.S. is 3,794,101 sq. mi. Let's round off these figures to  $1.637 \times 10^5$  and  $3.794 \times 10^6$ . In terms of area, roughly estimate how many Californias would make up one U.S. Then compute the answer to the nearest ones.

#### Exercise 6

The average distance from Earth to the moon is about  $3.84 \times 10^5$  km, and the distance from Earth to Mars is approximately  $9.24 \times 10^7$  km in year 2014. On this simplistic level, how much farther is traveling from Earth to Mars than from Earth to the moon?

### **Problem Set**

- 1. There are approximately  $7.5 \times 10^{18}$  grains of sand on Earth. There are approximately  $7 \times 10^{27}$  atoms in an average human body. Are there more grains of sand on Earth or atoms in an average human body? How do you know?
- 2. About how many times more atoms are in a human body compared to grains of sand on Earth?
- 3. Suppose the geographic areas of California and the U.S. are  $1.637 \times 10^5$  and  $3.794 \times 10^6$  sq. mi., respectively. California's population (as of 2012) is approximately  $3.804 \times 10^7$  people. If population were proportional to area, what would be the U.S. population?
- 4. The actual population of the U.S. (as of 2012) is approximately  $3.14 \times 10^8$ . How does the population density of California (i.e., the number of people per square mile) compare with the population density of the U.S.?
