Lesson 19: The Graph of a Linear Equation in Two Variables Is a

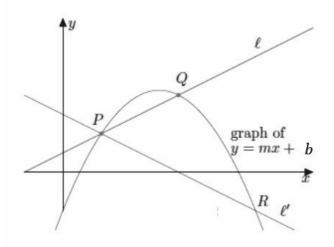

Line

Classwork

Exercises

THEOREM: The graph of a linear equation y = mx + b is a non-vertical line with slope m and passing through (0, b), where b is a constant.

- 1. Prove the theorem by completing parts (a)–(c). Given two distinct points, P and Q, on the graph of y = mx + b, and let l be the line passing through P and Q. You must show the following:
 - (1) Any point on the graph of y = mx + b is on line l, and
 - (2) Any point on the line *l* is on the graph of y = mx + b.
 - a. Proof of (1): Let R be any point on the graph of y = mx + b. Show that R is on l. Begin by assuming it is not. Assume the graph looks like the diagram below where R is on l'.

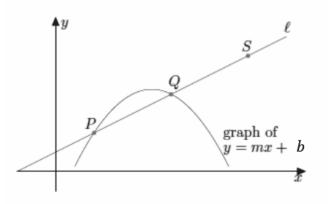

What is the slope of line l?

What is the slope of line l'?

What can you conclude about lines l and l'? Explain.

b. Proof of (2): Let *S* be any point on line *l*, as shown.

Show that *S* is a solution to y = mx + b. Hint: Use the point (0, b).

- c. Now that you have shown that any point on the graph of y = mx + b is on line l in part (a), and any point on line l is on the graph of y = mx + b in part (b), what can you conclude about the graphs of linear equations?
- 2. Use x = 4 and x = -4 to find two solutions to the equation x + 2y = 6. Plot the solutions as points on the coordinate plane, and connect the points to make a line.
 - a. Identify two other points on the line with integer coordinates. Verify that they are solutions to the equation x + 2y = 6.
 - b. When x = 1, what is the value of y? Does this solution appear to be a point on the line?

c. When x = -3, what is the value of y? Does this solution appear to be a point on the line?

- d. Is the point (3, 2) on the line?
- e. Is the point (3, 2) a solution to the linear equation x + 2y = 6?

- 3. Use x = 4 and x = 1 to find two solutions to the equation 3x y = 9. Plot the solutions as points on the coordinate plane, and connect the points to make a line.
 - a. Identify two other points on the line with integer coordinates. Verify that they are solutions to the equation 3x y = 9.
 - b. When x = 4.5, what is the value of y? Does this solution appear to be a point on the line?

c. When $x = \frac{1}{2}$, what is the value of y? Does this solution appear to be a point on the line?

- d. Is the point (2, 4) on the line?
- e. Is the point (2, 4) a solution to the linear equation 3x y = 9?

- 4. Use x = 3 and x = -3 to find two solutions to the equation 2x + 3y = 12. Plot the solutions as points on the coordinate plane, and connect the points to make a line.
 - a. Identify two other points on the line with integer coordinates. Verify that they are solutions to the equation 2x + 3y = 12.

b. When x = 2, what is the value of y? Does this solution appear to be a point on the line?

c. When x = -2, what is the value of y? Does this solution appear to be a point on the line?

- d. Is the point (8, -3) on the line?
- e. Is the point (8, -3) a solution to the linear equation 2x + 3y = 12?

- 5. Use x = 4 and x = -4 to find two solutions to the equation x 2y = 8. Plot the solutions as points on the coordinate plane, and connect the points to make a line.
 - a. Identify two other points on the line with integer coordinates. Verify that they are solutions to the equation x 2y = 8.
 - b. When x = 7, what is the value of y? Does this solution appear to be a point on the line?

c. When x = -3, what is the value of y? Does this solution appear to be a point on the line?

- d. Is the point (-2, -3) on the line?
- e. Is the point (-2, -3) a solution to the linear equation x 2y = 8?

6. Based on your work in Exercises 2–5, what conclusions can you draw about the points on a line and solutions to a linear equation?

7. Based on your work in Exercises 2–5, will a point that is not a solution to a linear equation be a point on the graph of a linear equation? Explain.

8. Based on your work in Exercises 2–5, what conclusions can you draw about the graph of a linear equation?

9. Graph the equation -3x + 8y = 24 using intercepts.

10. Graph the equation x - 6y = 15 using intercepts.

11. Graph the equation 4x + 3y = 21 using intercepts.

Lesson Summary

The graph of a linear equation is a line. A linear equation can be graphed using two-points: the *x*-intercept point and the *y*-intercept point.

Example:

Graph the equation: 2x + 3y = 9.

Replace *x* with zero, and solve for *y* to determine the *y*-intercept point.

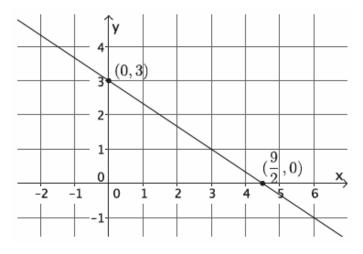

$$2(0) + 3y = 9$$
$$3y = 9$$
$$y = 3$$

The *y*-intercept point is at (0, 3).

Replace y with zero, and solve for x to determine the x-intercept point.

$$2x + 3(0) = 9$$
$$2x = 9$$
$$x = \frac{9}{2}$$

The *x*-intercept point is at $(\frac{9}{2}, 0)$.

Problem Set

Graph each of the equations in the Problem Set on a different pair of x- and y-axes.

- 1. Graph the equation: y = -6x + 12.
- 2. Graph the equation: 9x + 3y = 18.
- 3. Graph the equation: y = 4x + 2.
- 4. Graph the equation: $y = -\frac{5}{7}x + 4$.
- 5. Graph the equation: $\frac{3}{4}x + y = 8$.
- 6. Graph the equation: 2x 4y = 12.
- 7. Graph the equation: y = 3. What is the slope of the graph of this line?
- 8. Graph the equation: x = -4. What is the slope of the graph of this line?
- 9. Is the graph of $4x + 5y = \frac{3}{7}$ a line? Explain.
- 10. Is the graph of $6x^2 2y = 7$ a line? Explain.
